Dear Advacom Team

I am writing this to apply for the vacancy of 'Front End Developer, at Advacom'. Upon reading the job description, I recognised that my passion for coding and creativity aligns perfectly with your company's mission and the work you do.

I recently graduated from a Front-End focused boot camp in Utrecht. I hold a master's degree in Physiotherapy with three years of experience including a year where I built my clinic in a small town in India. Because of my strong desire to be in tech, I decided to switch my career last year. Since then, I've been enhancing my skills through self-study and various courses. I also completed Meta's 'Front End Specialization' course on Coursera.

I have strong knowledge of HTML, CSS Javascript, React, Typescript and Git which I have been practicing for more than a year now. During the boot camp, I also got hands-on with various frameworks and libraries like Next.js, Express, Prisma, Figma, Tailwind, and Jest. I have also worked on multiple group projects during my boot camp along with my portfolio project Physioscan (<https://physioplus.vercel.app/>). As I'm at the beginning of this journey, I'm eager to learn more about different technologies. For instance, during my portfolio project at the boot camp, I quickly learned and applied Leaflet for maps and Framer Motion for animations. I have a great eye for detail, with a strong sense of aesthetics and enjoy creating visually appealing websites.

My experience as a physiotherapist is also helpful in my new career. I used to work in multidisciplinary healthcare teams and communication was the key. I catered to a diverse set of patients, each presenting unique situations. This often required adapting the standard treatment to better suit the individual, which is very similar to how software is built by customizing and applying standard patterns.

Regards,
Richa Mahajan
